# THE EVOLUTION OF THE DIABETES MELLITUS IN SIBIU COUNTY DURING 2007-2009

# CARMEN NARCISA NATEA<sup>1</sup>

University,,Lucian Blaga" of Sibiu

Abstract: The adult diabetes epidemilogy is one of the most deficitary aspects of this disease in our Keywords: country. Diabetes became a health problem with major importance for persons, medicine and society... epidemiology, diabetes mellitus, incidence The asociate conditions and chronic complications in the prevalence of the diabetes is very impressive. The biologycal impact of the disease is major, evaluated by the decrease of life expectancy(mortality increase )due to the affected quality of life because of the acute and chronic complications. The most common are diabetic retinopathy, neuropathy, hipertension, which occure to a third of the newly diagnosed patients. The diabetes prevalence in Romania including both clinical manifested forms and the subclinical ones (altered glucose tolerance) varies according to geographycal area and urban and rural environment between 2-9 procents of the population. Periodic epidemiologycal studies are important for two reasons: they indicate the medical, social, financial, dimension of diabetes in a given population; the comparative follow-up of the incidence and prevalence of diabetes can reveal the diseases's tendency. Diabetes may be considered to have become an epidemic disease. The romanian epidemics amplitude is evaluated by the five years prospective study- EPIDIAB. Cuvinte **Rezumat:** Epidemiologia DZ la adult în tara noastră este unul dintre aspectele cele mai deficitare ale cheie: epidemiologie, diabet acestei afecțiuni. DZ a devenit o problemă de sănătate de importanță majoră pentru individ, medicină și zaharat, incidență societate. Prevalența complicațiilor cronice și a condițiilor asociate, în diabet, e impresionantă. Impactul biologic al bolii este considerabil, evaluat prin reducerea speranței de viață (creșterea mortalității), scăderea speranței de sănătate prin afectarea calității vieții, datorită complicațiilor acute, dar mai ales a celor cronice. Cele mai comune sunt retinopatia diabetică (RD), neuropatia, HTA, care

Impactul biologic al bolii este considerabil, evaluat prin reducerea speranței de viață (creșterea mortalității), scăderea speranței de sănătate prin afectarea calității vieții, datorită complicațiilor acute, dar mai ales a celor cronice. Cele mai comune sunt retinopatia diabetică (RD), neuropatia, HTA, care sunt întâlnite la 1/3 din bolnavii nou-descoperiți. Prevalența DZ în România, incluzând atât formele clinic manifeste, cât și cele subclinice ("toleranța alterată la glucoză") variază în funcție de zona geografică și mediu (urban și rural) între 2 și 9% din populație. Studiile epidemiologice periodice sunt importante din două motive (3): ele indică dimensiunea medicală, socială și, în final, financiară a diabetului zaharat într-o populație dată; urmărirea comparativă a incidenței și prevalenței diabetului zaharat poate informa asupra tendințelor pe care le are boala. Se poate considera că DZ a devenit o boală epidemică. Amploarea epidemiei din România se evaluează prin studiul prospectiv pe 5 ani – (EPIDIAB - Epidemia in Diabet).

#### INTRODUCTION

*Definition*: Health is a state of complete physical, mental and social wellness, it doesn't only imply the absence of disease and infirmity.(OMS)

Aside from the known diabetics there is at least a same amount of people without a specified diagnostic. The reasons are an uneducated population suffering by the disease's simptoms, a late medical consult and an unsatisfying training of the general practitioners in the diabetics problematics, especially because diabetes implies a long evolutions without any symptoms or with nonspecifics ones.

The results of diabetics' diagnosis in the population at risk adressed to the selected groups can not be correlated with the ones obtained in general population.

The diagnostic methods used are:

- glucose dosage in venous plasma TTGO
- 1100
- HbA1c

Table no. 1. The prevalence of the diabetes mellitus in different world countries

- the EPIDAB study

Figure no. 1. The percentage distribution of the diabetes known and unknown

1. The epidemiology of the Diabetes mellitus Type I in Romania:

In Romania, diabetes mellitus type 1 represented approx.. 7% of the ttotal forms of diabetes mellitus.

The cummulated incidence for a 10 years period in the studies made in our country show almost equal figures

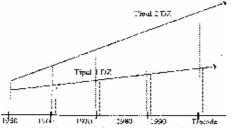

The distribution of the type I Diabetes mellitus over the decades, suggests a gradual genetic predisposition for  $\beta$  cell impairing, which can occur anytime in life.

The incidence varies depending on the geographical area, so the maximal incidence has been found in the N-W of Romania (Cluj)-5,5 cases /100000/year, and the minimal incidence – in Vaslui county-0,8 cases/100000/year.

Reported to the ethnic group- we found an increased incidence in the Hungarian people, comparing it with other people, (gypsy, germans, Serbians)-that explains the maintenance of genetic susceptibility;

Reported to the nutritional factors: cow milk, nitrates and nitrites, vitamin D, Zinc and nitrosamines were incriminated in the development of diabetes mellitus type I.

Figure no. 2. The diabetes mellitus type II incidence in the last two decades compared to the one of diabetes mellitus type 1

2. 2. The epidemiology of Diabetes mellitus Type II in Romania:

The real prevalence of this type of diabetes in Romania is 5% compared with patients diagnosed with type I diabetes which is 2% of people. Most cases are found in older people, (according to all studies), showing a high frequency of diabetes disease after a stroke. The number of people with type II diabetes increased in the last decades compairing with patients with type I diabetes which is relatively the same.

2. 3. The epidemiology chronic complications of Diabetes mellitus:

*Diabetic nephropathy* (DN) - is a progressive kidney disease which appears especially on patients with type I diabetes. There is a genetical predisposition for this complication (high frequency in people who had parents with diabetic nephropathy or parents with arterial hypertension). Clinical signs of DN appears after 5 years of damage progression, followed by a quickly increase of new cases, reaching at 25 new cases/year/1000 diabetics, after 10 years of progression. Later, the percentage of diabetics with DN may reach 20% after 15 years, 30% after 20 years and 35% after 40 years.

*Diabetic retinopathy* (DR) - does not progress in the same way with DN. DR has an incidence which progresses from 2%/year (after 3 years from onset) to 5%/year (after 5 years) and 10%/year (after 10 years), so after 15 years of progression, 90% of diabetics have "background retinopathy."Proliferative retinopathy occurs after 10-15 years of evolution, with a rate of 3%/year and it's prevalence is linear: 10% after 15 years, 20% after 20 years, 40% after after 30 years and 55% after 40 years.

*Diabetic neuropathy* - is defined by alteration of at least 2 electrophysiological parameters, and it occurs in varying percentages: 5% in type 1 diabetes and 15% in type II diabetes in 5 years of progression; DN can reach 10% in type I diabetes and 20% in type II diabetes after 10 years of progression, 15% in type I and 45% in type II after 20 years and 20% in type I and 60% in type II after 25 years of progression.

*Diabetic gangrene* and leg amputations - in Romania there are 7 cases/1000diabetics/year. This complication typically occurs in elderly men with type II diabetes.

Ischemic cardiopathy and cerebrovascular disease - are included in diabetic macrovascular disease and occur in both types of diabetes.

*Epidemiology of diabetic foot: diabetic foot* (DF) is a pathological status not a proper diagnosis. It is rather a concept that includes: peripheral neuropathy, angiopathy and infection. It is not necessary the coexistence of all the pathological features for the foot ulceration. Amputation and ulceration is the tragic outcome for diabetic foot. Amputation frequency varies a lot between countries and geographical areas. About 40-60% of non traumatic leg amputations are performed in diabetic patients. Incidence of leg amputation in most studies was established at 7-206/100000/year.

The number of patients with newly diagnosed diabetes in 2000 in the studied counties was 15097. EPIDIAB data: type I diabetes was 975 (6%), type II diabetes-14122 (94%); 3-6794(46,1%) and 2-8304 (53,9%).

The incidence of diabetes was 214,490/100000; type I-13,920/100000 and type II-200,60/100000.

#### THE AIM OF THE STUDY

Evaluate the incidence of diabetes in Sibiu county between 2007-2009, comorbidities and complications of diabetes during diagnosis.

# MATERIAL AND METHOD

Patients diagnosed with diabetes during 2007-2009 in the antidiabetic Center, Sibiu, were included in the study.

- -data were evaluated in EPIDIAB program, for 2007 2008 and 2009.

 we performed statistical processing of the following parameters: diabetes type, duration of disease, the distribution by gender, age of patients, environment, BMI, comorbidities and complications (arterial hypertension, dyslipidemia, ketoacidosis, cardiovascular disease, peripheral arteriopathy, diabetic neuropathy, retinopathy and nephropathy, therapeutic structure).

The results were obtained by analysing the evidence files of diabetics from ADC Sibiu, based on clinical examination (blood pressure measurement, abdominal size, body weight, BMI, testing sensitivities of legs and tendon reflexes, peripheral pulse palpation), blood tests (glucose, cholesterol, triglycerides, HDL cholesterol, LDL cholesterol, urea, uric acid, serum creatinine, proteinuria, urinalysis test), ophtalmoscope exam,

AMT, vol II, nr. 4, 2010, pag. 208

oscillometric exam, Doppler exam for the diagnosis of peripheral arteriopathy.

#### **RESULTS AND DISCUSSION**

EPIDIAB 2007 (January-December):

- disease incidence was 159,03%0000: 8,60% fot type I diabetes and 91,39% for type II diabetes.
- environment: 79,41% patients were from urban areas and 20,59% from rural areas.
- it was not reported significant differences between genders: 58.09% and 48.91%
- depending on age: 63,96% had 40-65 years old and over 65 (30,5%).
- depending on BMI-most patients are overweight (61,98%) and obese (17,23%)
- mild hypertension(18,81%)was prevalent in patient with type II diabetes (18,30%); severe form of hypertension was found only in patients with type II diabetes.
- dyslipidemia screening was performed in 63,56% (414 patient) and was positive in 39,05% of cases (217 patient).
- peripheral arteriopatia was found in 14,49% (80) of 552 investigated patience, and prevailed in type II diabetes.
- ischemic cardiopathy-was detected in 39,8% (201 patient). 196 had type II diabetes.
- cerebrovascular disease was detected in 38 patient (5,64%) with type II diabetes.
- diabetic retinopathy is present in 9.35% of cases ( 63 of 180 investigated patient).
- diabetic nephropathy was detected in 1,63 of patient (11).
- diabetic polyneuropathy was detected in 4,55% (23 cases) from 269.
- ulcers were detected in 1,58% from cases (8 patients)
- therapeutic structure reveals 52,28% patients with diet, treated with sulfonylureas, 16, 44 8.51% % with methformin, 5,35%-SU+metformin,-all patient with type II diabetes; insulin therapy was instituted in 11,68% in patient (all of them with type I diabetesand 8,79% with type II diabetes and 5,74%-had other therapies.)
- all patient were enrolled in education programs about diabetes (lifestyle, therapy, generalities about diabetes).

40% of patient received glucometers.

EPIDIAB 2008(January-December):

- \*disease incidence was 164,37%0000: 3,17% fot type I diabetes and 96,83% for type II diabetes.
- environment: 77,34% in patient were from urban areas and 22.66% from rural areas.
- it was not reported significant differences between genders: 52,02% and 47,98  $\cancel{3}$ )
- depending on age: 62,68% had 40-65 years old and over 65 (33,13).
- depending on BMI-most patients are overweight (64,84%) and obese (15,71%)
- mild hypertension(18,44%)was prevalent in patient with type II diabetes (18,30%); severe form of hypertension was found only in patient with type II diabetes.
- dyslipidemia screening was performed in 91,99% (620 patient) and was positive in 39,05% of cases (271 patient).
- peripheral arteriopatia was found in 14,49% (80) of 552 investigated patience, and prevailed in type II diabetes.
- ischemic cardiopathy-was detected in 39,80% (276 patient). 260 had type II diabetes.
- cerebrovascular disease was detected in 109 patient (21,58%) with type II diabetes.
- diabetic retinopathy is present in 10,95% of cases (76 of 265 investigated patient).
- diabetic nephropathy was detected in 2,45 of patient (17

patient).

- diabetic polyneuropathy was detected in 5,82% from 302.
- ulcers were detected in 1,87% from cases (13 patients)
- therapeutic structure reveals 50,86% patients with diet, treated with sulfonylureas, 17,29 8.65% % with methformin, 6,2%-SU+metformin,-all patient with type II diabetes; insulin therapy was instituted in 12,97% in patient (all of them with type I diabetes and 10,12% with type II diabetes and 5,48%-had other therapies.)
- all patient were enrolled in education programs about diabetes (lifestyle, therapy, generalities about diabetes).
- 60% of patient received glucometers.
- EPIDIAB 2009(January-December):
- disease incidence was 189,35%0000: 7,61% fot type I diabetes and 98,39% for type II diabetes.
- environment: 79,41% in patient were from urban areas and 20,59% from rural areas.
- it was not reported significant differences between genders: 61,09% and 38,91?)
- depending on BMI-most patients are overweight (61,98%) and obese (47,23%)
- depending on age: 63,96% had 40-65 years old and over 65 (23,5%).
- mild hypertension(18,81%)was prevalent in patient with type II diabetes (78,81%); severe form of hypertension was found only in patient with type II diabetes.(3,17)
- dyslipidemia screening was performed in 63,56% (621 patient) and was positive in 44,16% of cases (523 patient).
- peripheral arteriopatia was found in 30,69% (115) of 255 investigated patience, and prevailed in type II diabetes.
- ischemic cardiopathy-was detected in 39,8% (301 patient). 276 had type II diabetes.
- cerebrovascular disease was detected in 98 patient (5,64%), all with type II diabetes.
- diabetic retinopathy is present in 9,50% of cases (78 of 247 investigated patient).
- diabetic nephropathy was detected in 3,99 in patient (18).
- diabetic polyneuropathy was detected in 4,55% (43 cases) from 369.
- ulcers were detected in 1,58% from cases (10 patients)
- therapeutic structure reveals 52,28% patients with diet, treated with sulfonylureas, 16, 44 8 51% % with methformin, 5,35%-SU+metformin,-all patient with type II diabetes; insulin therapy was instituted in 13,97% in patient (all of them with type I diabetes and 8,79% with type II diabetes and 5.74%-had other therapies.)
- all patient were enrolled in education programs about diabetes (lifestyle, therapy, generalities about diabetes). 90% of patient received glucometers.

# CONCLUSIONS

- The number of the patients with newly detected diabetes 1. which were included in EPIDIAB program in 2000 was 15097; in Sibiu county were reported 959 new cases of diabetes.
- In 1975 were registered 1575 patients with diabetes 2. mellitus in Sibiu county, in 2006 were registered 12274 cases, with 1208 much more/year. In 2009 were 16836 diabetes cases and in the first semester of 2010-644 cases of diabetes mellitus.
- Predominantly patients are from urban area comparing with 3. rural area.
- 4. Sibiu County it was registered a continuous increase of type II diabetes reaching at 10778 in 2007, while in 2008 it has registered 12204 type II diabetes cases.

## Table no. 2. The evolution of the cases of diabetes mellitus in the county of Sibiu during 1975-2010

#### Tabel no. 3. EPIDIAB Programme (7)

OBJECTIVES	PURPOSES
1. Epidemiological analysis	1. Knowledge of the diabetes epidemic
	-magnitude and dynamics of incidence
	-demographic correlations
2.Care quality analysis	-knowledge of current levels of quality care.
	Improving the consequences of diabetes complications, quality of life.
	-improving cost benefit.
3. Strategic prediction	Developing appropriate preventive strategies and the quality of care

- 5. The increasing of diabetes cases was proved by the increasing consultation number.
- 6. It has been found an increase of diabetes incidence in Sibiu county from 159,03%000 in 2005 to 164,37%000 in 2006 and 189,35%000 in 2007 during the EPIDIAB program.
- 7. Most of the newly diagnosed patient are from urban area (>70%), prevailing women.
- Most of newly diagnosed patient were overweight or obese (>70%).
- 9. 1/3 of newly diagnosed patient were presented with a different form of arterial hypertension (slight and medium).as well as ischemic heart disease (>35%) and severe cardiovascular disease (5% in cases, especially type II diabetes).
- 10. Over 50% of newly diagnosed cases had dyslipidemia in 2007 -523 patients comparing to 2005 (271).
- 11. The specific complications of diabetes were found since the beginning of the diagnosis: over 4% polineuropathy, with 1,58% severe forms of legs gangrene, diabetic nephropathy (.3,5%), diabetic retinopathy (>9%) tending to increase in the last years of complicated cases since onset which proves the silent evolution of diabetes in the first 4 or 5 years.
- 12. Newly diagnosed patient needed differential therapy: >50% only by diet and the rest needed mixed therapy: diet +- insulin+/-OAD.
- 13. The absence of medical education, appropriate lifestyle and diet, led to complications of the diabetes.
